

NetworkTimeManager Class

Description

Provides a current UTC network time from a group of NTP servers on the internet.

- The time is directly synced with the current device system time.
- If internet connection is lost, the time continues uninterrupted as long as the system time has not changed significantly between update frames and the application has not been paused very long.
- Exceptions are caught and shown in the debug log.

Public Properties

Instance	Reference to this object class as a single instance. (Static Read Only)
DateTimeUtc	The current network time in UTC. (Read Only)
IsTimeInSync	Is the network time in sync with the device system time. (Read Only)

Public Methods

ForceTimeResync	Set network time as off sync and resync to a NTP server.
